

1 Baseline

Unassisted items; accuracy, confidence and covariates.

2 Random assignment

One of four practice regimes (A-D).

A Answer-first AI

Verdict shown before the user judges.

B Evidence-first AI

Evidence work before the verdict.

C Active practice

The same work, without AI.

D No practice

Matched-duration unrelated activity.

3 Practice period

A-C: enough trials or sessions for learning to be possible.
D: matched-duration activity.

4 Immediate probe

Novel items; tool on a random half in AI arms; matched block in the other arms.

5 Delayed test

7-14 days later; novel items; near / mid / far transfer; no tool.

Before analysis

Audit tool availability, item sets and randomised orders.

TRC

With vs. without tool; within person, at probe.

ETE

AI arm vs. C and vs. D; between arms, delayed.

Report with every ETE: comparator (C and D), delay, test access regime, item novelty, transfer distance, dose, smallest effect of interest, and equivalence decision.
